## Environmental and Air Quality Monitoring

Ensure compliance by capturing real-time data on environmental conditions and air quality.

Blind spots in critical environments create compliance failures and costly incidents. Thinaer eliminates them. Our BLE sensors capture continuous, real-time data on temperature, humidity, air pressure, particulate matter, O3, CO2, VOCs, and other common gases. Everything flows through our SaaS platform Sonar, allowing your team to see what's happening across every monitored space, without manual rounds.

### What's covered

#### Regulatory Standards

Regulatory and operational standards for controlled environments are complex and demanding. Thinaer makes them manageable. We connect the equipment you already own to SONAR, giving your team continuous visibility and automated alerts without rip-and-replace projects.

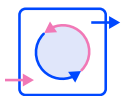

#### Pressure Management

Maintaining the right pressure differential is critical across industries, from pharmaceutical manufacturing to aerospace bonding operations to healthcare isolation. Our sensors provide continuous confirmation that conditions stay within spec, with immediate SONAR alerts when they drift, before an excursion becomes a quality escape or compliance incident.

#### Filtration Systems

Connect your air handling systems with smart sensors to maintain filtration requirements across cleanrooms, controlled manufacturing environments, and critical care facilities. Continuous monitoring catches failures that manual inspection cycles miss, and your data flows through SONAR and any other systems you choose via open APIs. No rip-and-replace required.

#### Ventilation Monitoring

Gain clear visibility into ventilation effectiveness across every critical space in your operation. Monitor air changes, track inlet and outlet performance, and understand the physical configuration of each environment, all through SONAR's real-time dashboards. Your data flows where you need it. One platform, any environment, total visibility.

Thinaer deploys the right technology for your environment, delivers immediate visibility through SONAR, and flows your data to any analytics or compliance tools you already use. We handle the complexity of connecting physical operations to digital systems so your team can focus on what the data reveals, not on how to capture it. One partner, any hardware, total visibility. No lock-in. No starting over. Find out how at [thinaer.io](https://thinaer.io).
